

CrewTracker Software™ is designed to manage your snow business from A to Z. CrewTracker does not just track crews, it's for data management, crew management, and collapsing the time needed for invoicing/payroll, and so much more! CrewTracker Software™ creates a central location to keep all of your data; it also integrates with QuickBooks™.

During the winter event, you now have a way to see everything going on in the field as it happens with 100 different ways to view real-time reports. No more wondering where crews are or what properties have been started or completed. See their progress as it happens!

You're already busy enough managing your response to the winter event, let the customized CrewTracker web portal do some of the work for you! The portal is a way to provide passive communication to your clients and crews. Here's how our web portal works:

- customers, area managers, company managers, subcontractors, and your crews can see their appropriate information
- eliminates unnecessary calls from clients and crews in the field
- all of this information can be viewed from anywhere you have internet access

Once the winter event is over, collapse the time it takes to get your invoices and crew pay out. All of the data is captured in real-time during the event; you are not waiting on any time sheets or guys trying to remember what happened. All you have to do is review the data that came in during the storm, make any changes necessary and you're ready to invoice and pay your crews quickly with QuickBooks™.

Because CrewTracker Software™ is event-driven, it stands above all other software attempting to provide snow and ice management. This means that when the event is over, your paperwork is done and your invoices are out, you're waiting for the next event. We all know that winter events don't come on a schedule so why should your software be organized that way?

What you can expect as a client:

- two days of training to gain a complete understanding of the software
- Annual CrewTracker Software™ Users Conference where we cover the more detailed features of the software and any new enhancements
- Annual CrewTracker Software™ Update Webinar Training
- training materials for in-house crews and contractors
- technical support via email and phone
- marketing and sales materials to increase your customer base

Benefits:

- capture start and stop time, surface temperature and ambient temperature, site conditions, and the type of material and quantity used
- project and track material quantities for each property and/or event
- know where your crews are and what they're doing
- no need for crazy spread sheets/ time sheets piling up on your desk
- no special equipment needed
- no more costly mistakes such as unbilled services performed or incorrect billable time
- all data for every event is saved for future analysis and any litigation needs

Technical Specifications:

Network Requirements (Server)

- optimal 150mb disk space (for growth) -minimum is 50mb

System Requirements (PC's)

- Windows XP and Windows 7
- 120mb hard disk space
- 1gb RAM recommended (512 minimum)
- for more than one PC -peer to peer network or server network (100mb min speed)
